

# Sharing Reproducible Computational Environments with

# Packaging software is hard...

- Hardware
- Software
- Programming language
- Packages and libraries
- The code itself
- Resources

# What is binder?

- Public, free to use service
- Provides hardware, software and code
- Creates a link to a browser window where code, running in the Cloud, can be explored interactively
- <https://mybinder.org>

Turn a Git repo into a collection of interactive notebooks

Have a repository full of Jupyter notebooks? With Binder, open those notebooks in an executable environment, making your code immediately reproducible by anyone, anywhere.

Build and launch a repository

GitHub repository name or URL

GitHub ▾

Git branch, tag, or commit

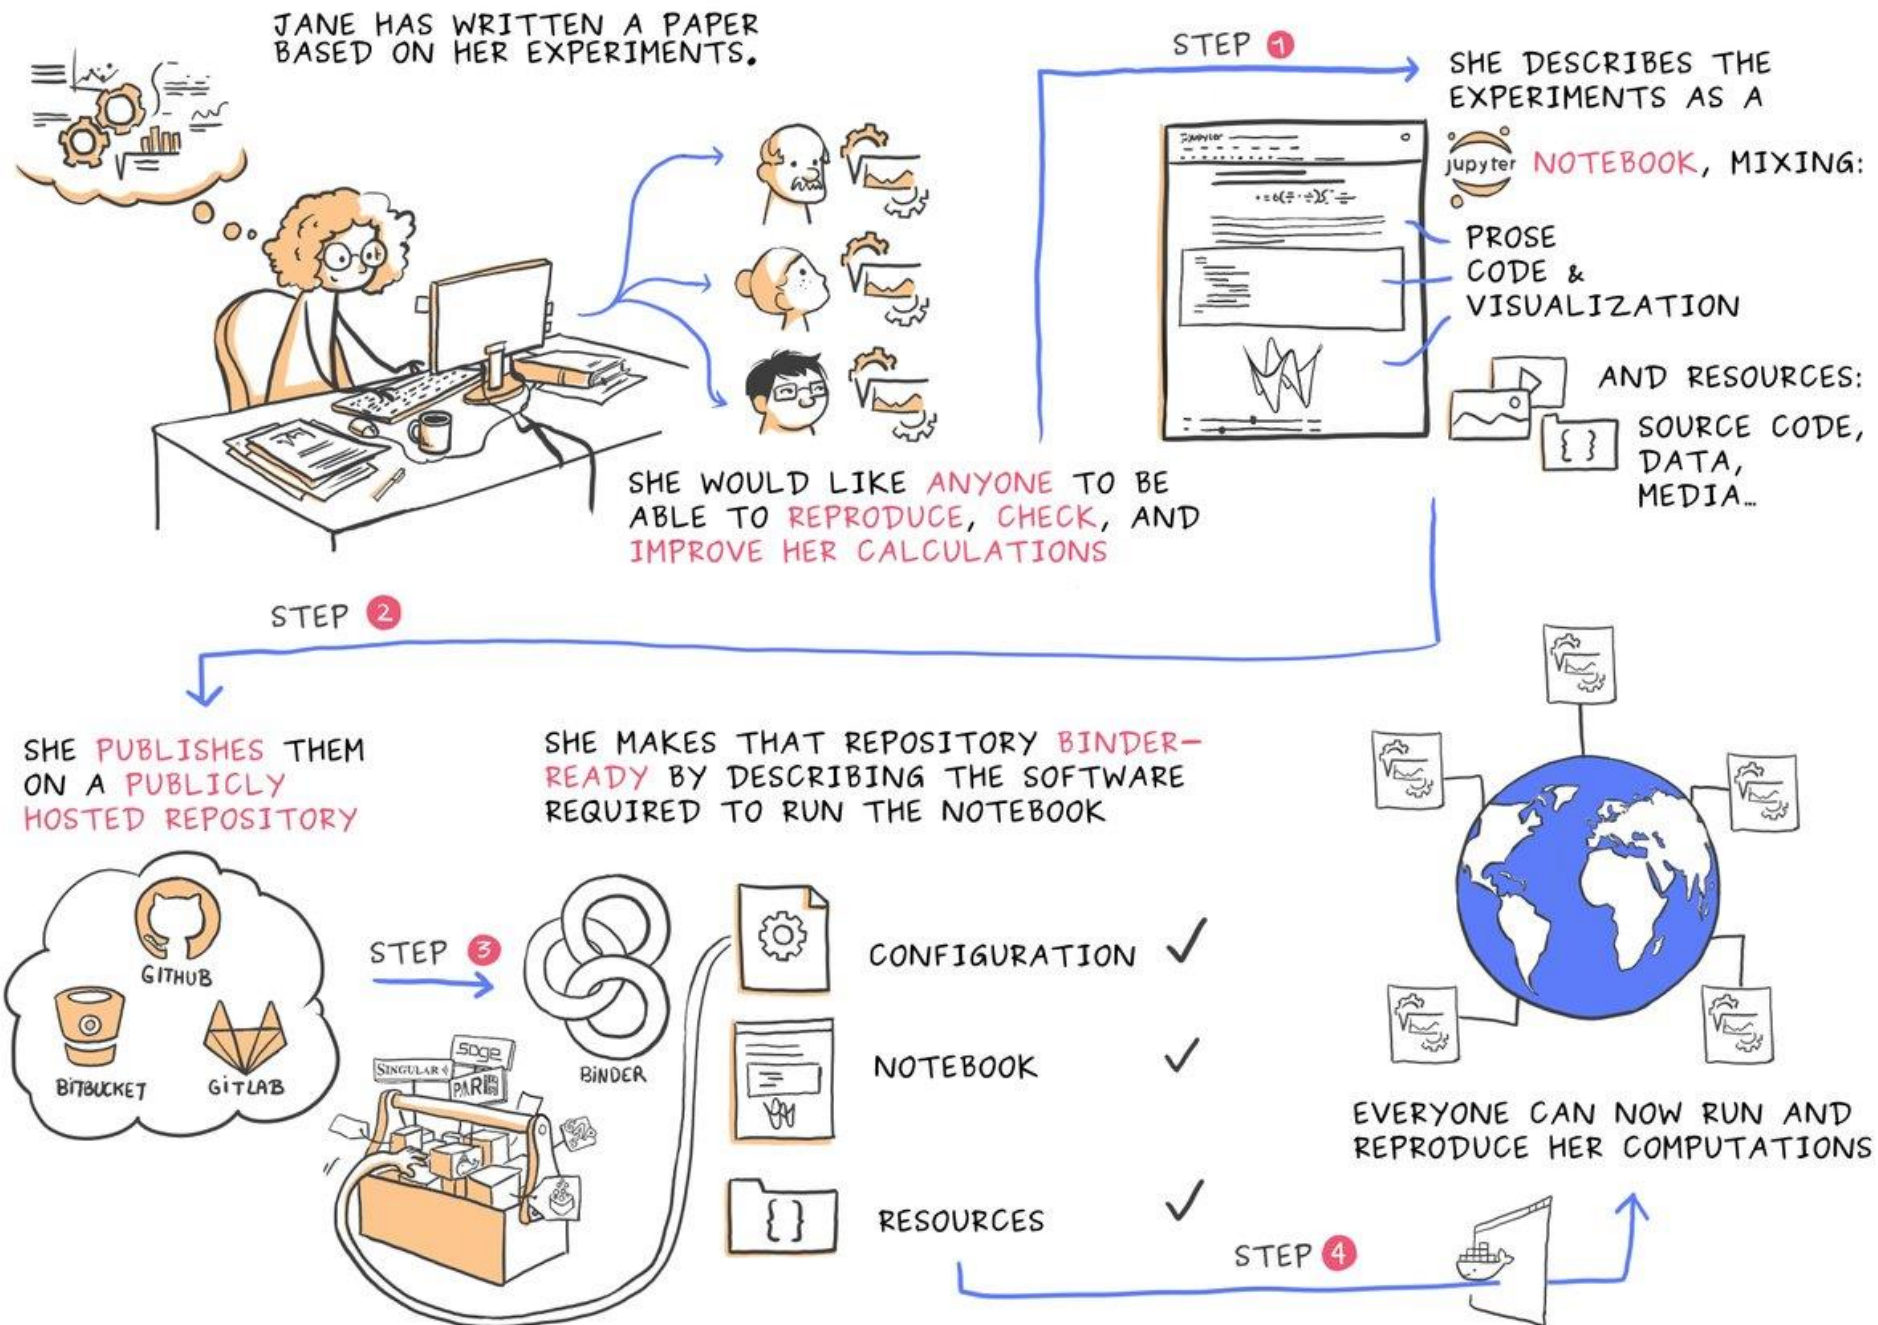

Path to a notebook file (optional)

File ▾ launch

Copy the URL below and share your Binder with others:

📋

Copy the text below, then paste into your README to show a binder badge: 🔗 launch binder ▶

# Easy as 1, 2, 3...

- Step 1: Create a config file for your project
- Step 2: Enter repo URL into mybinder.org
- Step 3: Hit launch!

[bit.ly/zero-to-binder-solo](https://bit.ly/zero-to-binder-solo)

Branch: master	New pull request	Create new file	Upload files	Find File	Clone or download
betatim Merge pull request #3 from betatim/update-pins Latest commit fa84f12 14 days ago					
LICENSE	Create LICENSE	9 months ago			
README.md	Update README.md	2 months ago			
index.ipynb	first move	2 years ago			
requirements.txt	Bump numpy pin	2 months ago			
runtime.txt	Pin Python version to 3.5	14 days ago

# Open With Binder browser extension

- Available for Chrome and Firefox
- Launch a repo in Binder directly from the GitHub page!

# Types of config files... Python with pip

pip freeze > requirements.txt

4 lines (3 sloc) | 45 Bytes

RawBlameHistory

```
1  numpy==1.16.*  
2  matplotlib==3.*  
3  seaborn==0.8.1
```

<https://github.com/binder-examples/requirements/blob/master/requirements.txt>

# Types of config files... Python with conda

conda env export > environment.yml

14 lines (13 sloc) | 161 Bytes

```
1  name: example-environment
2  channels:
3    - conda-forge
4  dependencies:
5    - numpy
6    - psutil
7    - toolz
8    - matplotlib
9    - dill
10   - pandas
11   - partd
12   - bokeh
13   - dask
```

[https://github.com/binder-examples/python-conda\\_pip/blob/master/environment.yml](https://github.com/binder-examples/python-conda_pip/blob/master/environment.yml)

# Types of config files... runtime.txt

- Specify a Python 2.7 environment
- (Can also be achieved using environment.yml and conda)

1 lines (1 sloc) | 10 Bytes

Raw Blame History

1 python-2.7

# Types of config files... R environments

install.R <- This is a made-up file!

```
6 lines (5 sloc) | 148 Bytes
1  install.packages("tidyverse")
2  install.packages("rmarkdown")
3  install.packages("httr")
4  install.packages("shinydashboard")
5  install.packages('leaflet')
```

If you have an R package, the DESCRIPTION and NAMESPACE files are (almost) enough to describe the dependencies

<https://github.com/binder-examples/r/blob/master/install.R>  
<https://github.com/binder-examples/binder-r-description>

# Some caveats for R users...

- Need a runtime.txt file
  - Binder uses MRAN to pull packages
  - MRAN takes daily snapshots of CRAN
- Some packages take a long time to install...
  - E.g. tidyverse
  - Either only list the required packages or create bespoke Dockerfile
  - <https://github.com/binder-examples/rocker>
  - <https://github.com/karthik/holepunch>

# Types of config files... All the cool things!

## Binder supports:

- Julia, Stencila, Bokeh, Octave (free MatLab)...
- apt and nix package managers
  - E.g. LaTeX, vim...

[https://mybinder.readthedocs.io/en/latest/config\\_files.html](https://mybinder.readthedocs.io/en/latest/config_files.html)

- Java for plotting:  
<https://github.com/twosigma/beakerx>
- Octave JupyterBook:  
<https://joergbrech.github.io/Modellbildung-und-Simulation/intro>
- Jupyter kernel for C++:  
<https://github.com/QuantStack/xeus-cling>
- Multi-language:  
<https://github.com/binder-examples/multi-language-demo>
- Continuously build notebook containers:  
<https://github.com/binder-examples/continuous-build>

# More cool things... IDEs

JupyterLab and RStudio are installed by default

Accessed via lab or rstudio values to  
?urlpath= URL argument

Copy the text below, then paste into your README to show a binder badge:

# postBuild scripts... Getting data and more

- Executed in the container after the environment has been built
- Bake datasets into the environment
- Execute scripts before the user arrives in the environment
- bash commands

Executable File	12 lines (10 sloc)	200 Bytes
-----------------	--------------------	-----------

```
1  set -ex
2
3  invoke build --env-name=root --no-kernel
4  invoke demofiles
5  invoke talk -t demo
6  rm -rf demofiles
7  rm -rf notebooks
8  rm -rf narrative
9  rm -rf slides
10 rm demo/notebooks/Julia.ipynb
11 jupyter lab clean
```

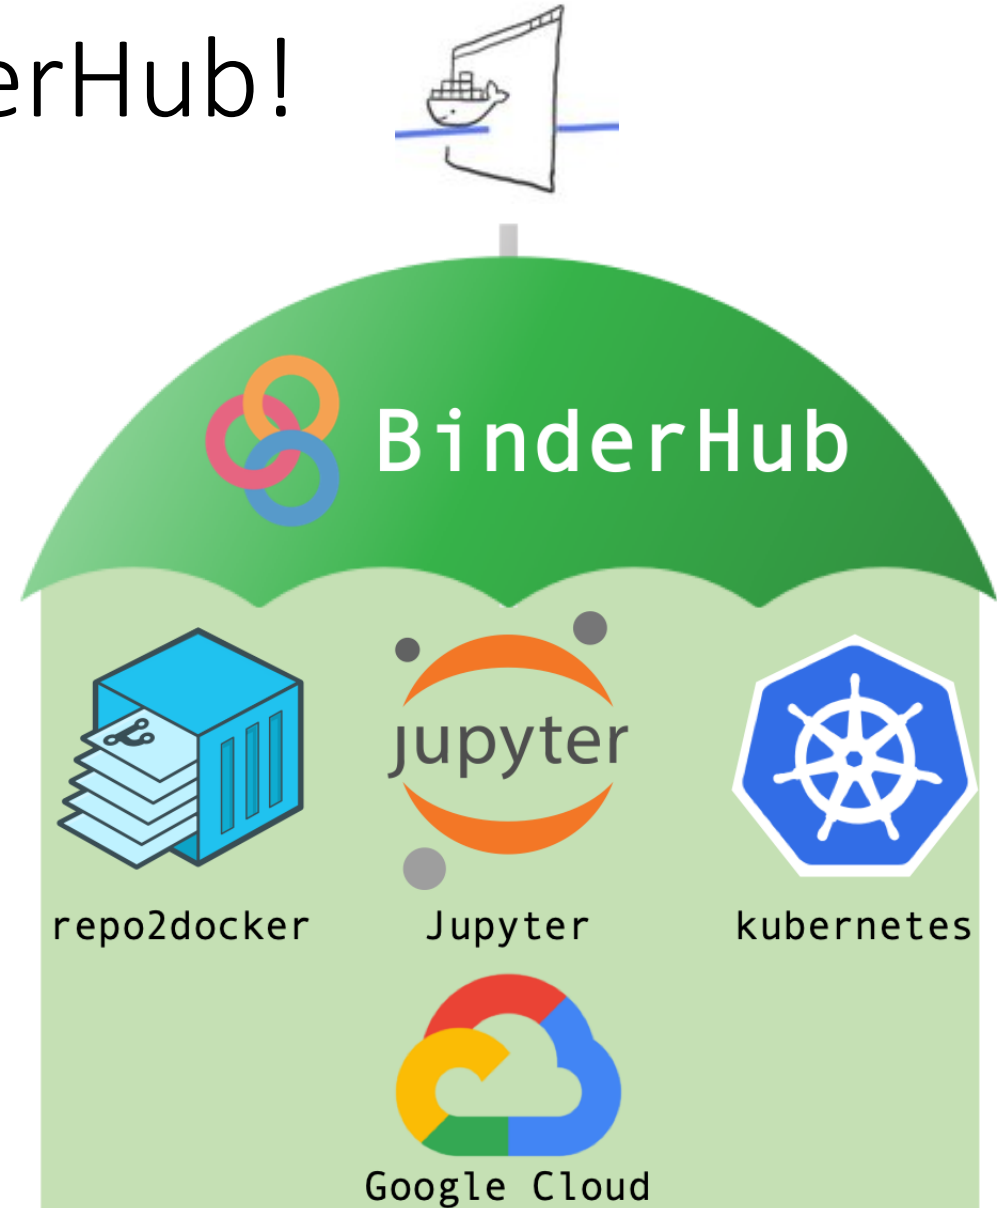

# Important things to remember about Binder

- **Changes are not saved!**
  - Anything you've done will be lost when the browser is closed
  - Pushes to the original repo are not currently permitted, though see:
  - <https://github.com/jupyterhub/binderhub/issues/623>
- **mybinder.org is completely public!**
  - Don't put anything in your binder that you don't want shared with the world
- The image is rebuilt with each new commit, not each launch
  - Relaunches *should* be quicker (but not always)

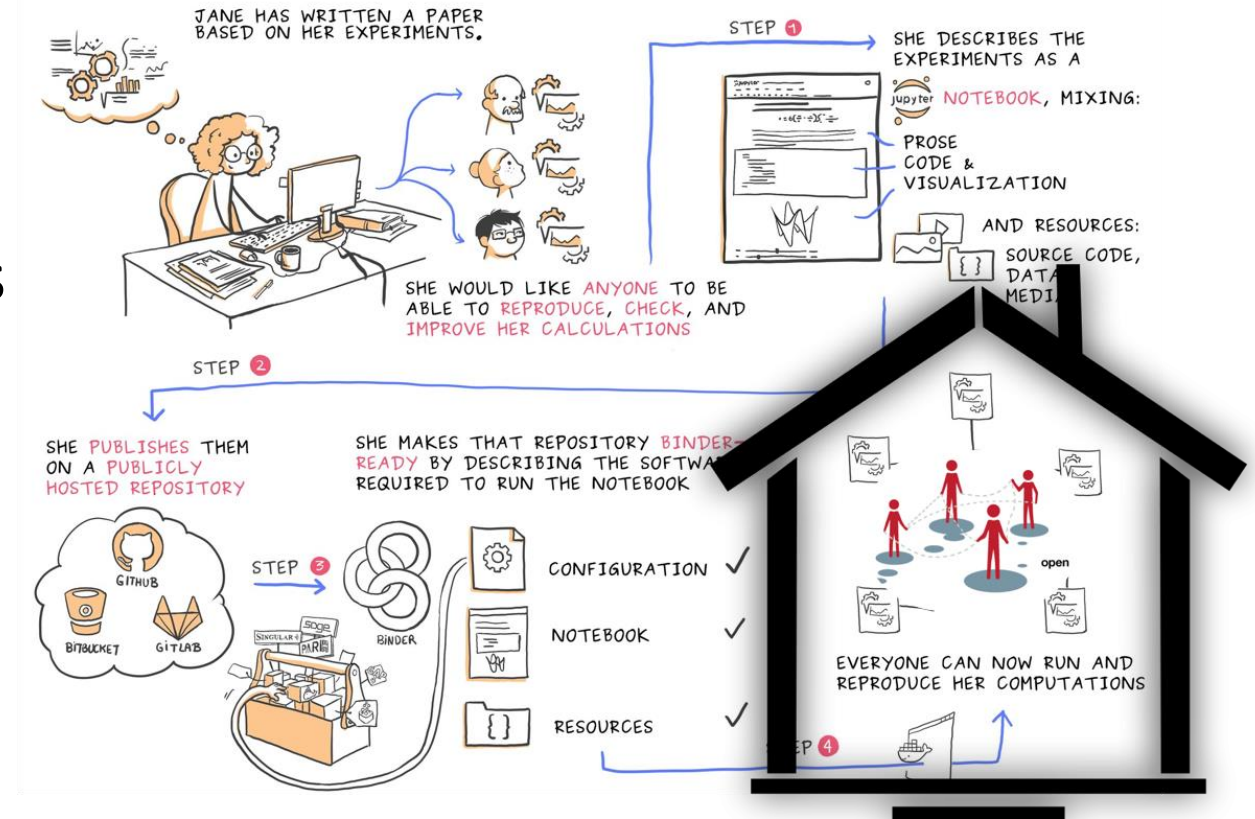

# Under the hood... a BinderHub!

- Cloud-based technology
  - currently operating on Google Cloud
  - Kubernetes automatically manages computational resources and deploying containers on to the Cloud
- repo2docker
  - builds a docker container based on a config file and a GitHub repo contents
- JupyterHub
  - connects Cloud server with your browser

# Why bother building a BinderHub?

- Authentication
- Private repo access
- Control computational resources
- Choose to share amongst teams or publicly
- They're cool!

# Hub23 is coming!

- The BinderHub for Hut23 and Turing research hosted on Azure
- Current implementation:
  - Autoscaling
  - Login via GitHub
  - Can only build public repos
  - Docker images are still pushed to a public DockerHub account
  - Limited to .5 vCPU and 1GB RAM
- Roadmap:
  - Login in via Azure Active Directory as well (minimum plan: tweak the current login schema)
  - Exchange DockerHub for Azure Container Registry (images will now be private)
  - Grant access to build private repos
